## **DETAILED ACTION**

### ***Response to Amendment***

1. The amendment received on 11/02/2005 has been reviewed and considered with the following results:

As to the prior art rejections to the claims, Applicant's amendments have overcome the previous prior art rejections mailed on 8/23/2005, as such; the rejections have been withdrawn. Therefore, the case is found to be in allowance condition for the reasons as set for below. In view of the inclusion of all of the limitations of new added claims 21-27 within base claims 4 and 12, which have been indicated allowable in the office action mailed on 08/23/2005, therefore, claims 21-27 are also allowed.

## **REASON FOR ALLOWANCE**

2. The following is an examiner's statement of reasons for allowance:

Applicant has canceled all rejected claims presented in the previous Office Action mailed on 8/23/2005. As to pending claims of the application, the prior art of record fails to disclose or fairly suggest an microcontroller integrated circuit, as recited in claim 4, having specific structural limitations such as a frequency locked loop (340 in instant Fig. 4) further including a ramp generator (420), wherein the ramp generator starts a first ramp upon a first edge of the first signal (198), and wherein a first digital value indicative of a magnitude of the first ramp is determined upon a first edge of the second signal (196), and wherein the ramp generator starts a second ramp upon a second edge of the first signal, and wherein a second digital value indicative

of a magnitude of the second ramp is determined upon a second edge of the second signal, the first and second digital values being used to generate a third digital value, the third digital value being supplied to the digital filter (460), and being configured in combination with the rest of the limitations of the base claims and any intervening claims.

The prior art of record fails to disclose or fairly suggest an microcontroller integrated circuit, as recited in claim 12, having specific structural limitations such as the clock multiplier circuit (as shown in Fig. 9) includes a control loop (607, 609), the control loop including an oscillator (607) and a loop divider (639), the loop divider being a counter that is preset with a preset value (651), and wherein a phase of the second signal (618) is adjusted with respect to the first signal (REF CLOCK) by changing the preset value; such as the preset value a digital six, loop divider 639 therefore counts from the preset value of six, seven, eight. When the loop divider 639 transitions the count state eight, the feedback clock (641) transitions high (as illustrated in Figure 10). Loop divider 639 continues to count the count state rolls over from the terminal count sixteen to the count value Upon entering count state zero, the feedback clock FEEDBACK CLOCK transitions as illustrated in Figure 10. Because the synchronization pulse SYNC PULSE generated from the reference clock, changing the preset value to which the loop divider is preset can change the time 652 between the rising edge of the feedback clock and the falling edge of the reference clock; and being configured in combination with the rest of the limitations of the base claims and any intervening claims.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
